**DATE:** December 2, 2022  
**FILE:** 1085-42

**RE:** Summary of fisheries monitoring completed on the Kokish River in 2022 for the  
Kokish River Hydroelectric Project

---

This memorandum summarizes the ongoing fisheries work carried out by Ecofish Research Ltd. (Ecofish) in 2022 for the Kokish River Hydroelectric Project (the Project), which is operated by Evolgen. Fisheries monitoring was required by the Project's Operational Environmental Monitoring Plan (OEMP) (Lewis *et al.* 2014) from 2013 to 2018 as summarized in six previous memos (Wright and Faulkner 2013; Wright 2014, 2015; Wright and Thornton 2016; Wright and Lewis 2017; Wright and Thornton 2018) and presented in detail in annual OEMP reports. Fisheries monitoring was not required in 2019, 2020, or 2021 therefore these memos (Wright and Dinn 2019, 2020, 2021) contained information only pertaining to flow compliance.

In 2019, an OEMP summary report was prepared in which data from five years of operational monitoring completed between 2014 and 2018 were compiled. Data from baseline (before) and operational (after) periods were compared using a Before-After-Control-Impact (BACI) analysis, where applicable, for seven parameters: water flow, water temperature, stream morphology, fish community, stream water quality, groundwater quality, and invertebrate drift.

The OEMP summary report was submitted to regulators in Fall 2019. No further monitoring is required under the OEMP for groundwater quality, water temperature, stream morphology, stream water quality, or invertebrate drift monitoring components. Monitoring will continue for flow, including instream flow compliance and ramping rate compliance. On-going monitoring of the Kokish spillway channel, headpond, powerhouse tailrace, fish stranding monitoring and salvage will also continue. One more year of fish community monitoring, in Year 10 (2023), is prescribed by the OEMP.

The objective of this memo is to provide a summary of monitoring related to fisheries in the Kokish River in 2022. The OEMP did not require fisheries monitoring in Year 9 of operations, and therefore 2022 monitoring was restricted to flow compliance.

## 1. FLOW COMPLIANCE

Stage and flow data are continuously collected to assess Project compliance with the terms and conditions of the conditional water licence (CWL) and to evaluate changes in hydrological conditions due to Project operations (as per the OEMP; Lewis *et al.* 2014). Instream Flow Requirements (IFR), which are detailed in the CWL were set following the Environmental Assessment Process for the Project. Furthermore, ramping rate criteria, which are the rate of stage changes allowable during Project ramp-downs, were established based on general criteria accepted by Fisheries and Oceans Canada (e.g., Cathcart 2005) to reduce potential fish stranding for fry at sensitive sites within the diversion and downstream reaches.

Hydrometric stations were established at three locations on the Kokish River to provide real-time, instantaneous stage and flow data for the life of the Project: downstream of the intake, upstream of the powerhouse and downstream of the powerhouse (Map 1). The uppermost site (UKO-LG01), located downstream of the intake, is the compliance point for monitoring IFR and diversion ramping rates. The lowermost site (KOK-DSLG01), located downstream of the powerhouse, is the compliance point for downstream ramping rates. The station that was previously installed upstream of the powerhouse (LKO-LG01) is not required for flow compliance monitoring and was therefore decommissioned in June 2018.

Station servicing and discharge measurements were collected at different flows during 2022 (Year 9 of the OEMP), as they have been in all monitoring years. Updates to the stage-discharge rating curves and sensor offsets were applied based on these results and an annual hydrology report will be produced to detail the status and present stage and discharge data for the flow compliance monitoring stations.

## 2. SUMMARY

This memorandum summarizes the ongoing fisheries work carried out by Ecofish in 2022 to meet the requirements for Year 9 of the Kokish River Hydroelectric Project OEMP.

The field study components in 2022 were restricted to instream flow. Field work scheduled to occur during the winter of 2022/2023 includes flow compliance monitoring, and maintenance of the hydrometric stations.

Yours truly,

**Ecofish Research Ltd.**
